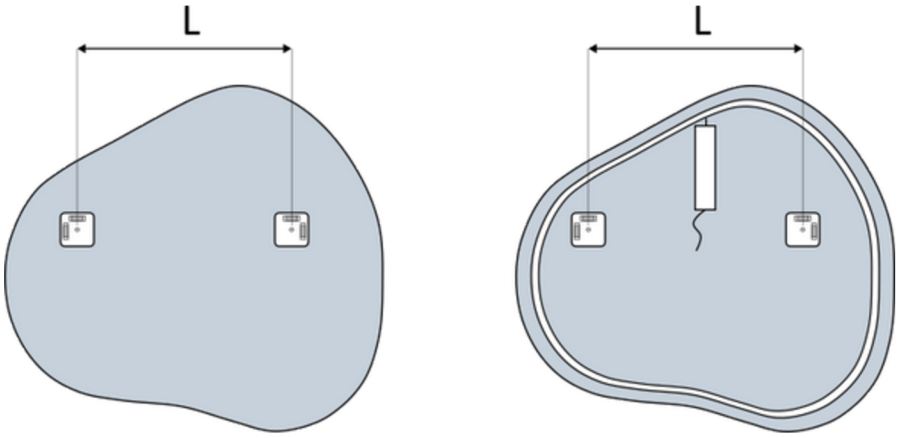
Mirror assembly instructions

IMPORTANT – Please read the safety instructions carefully before installation.

1

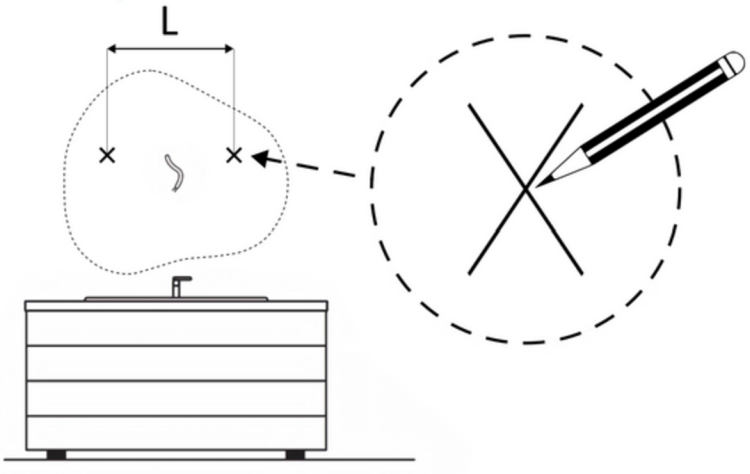
Measure the width of the mounting brackets.
Please note that the mirror construction may vary depending on the model selected.



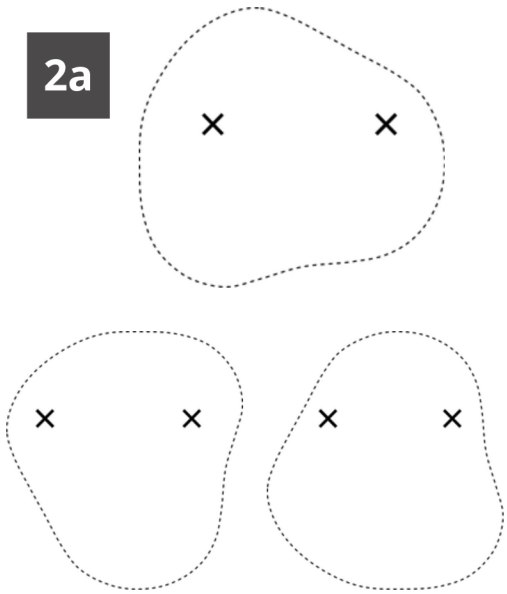
SIMPLE LED

2

Apply the previously measured dimension to the wall.
Some mirrors can be hung both horizontally and vertically (Fig. 2a).



2a



RUKE®

3

Attach the mounting pins to the previously marked location.
Please note that the depth to which the plugs should be screwed in will vary depending on the model selected.

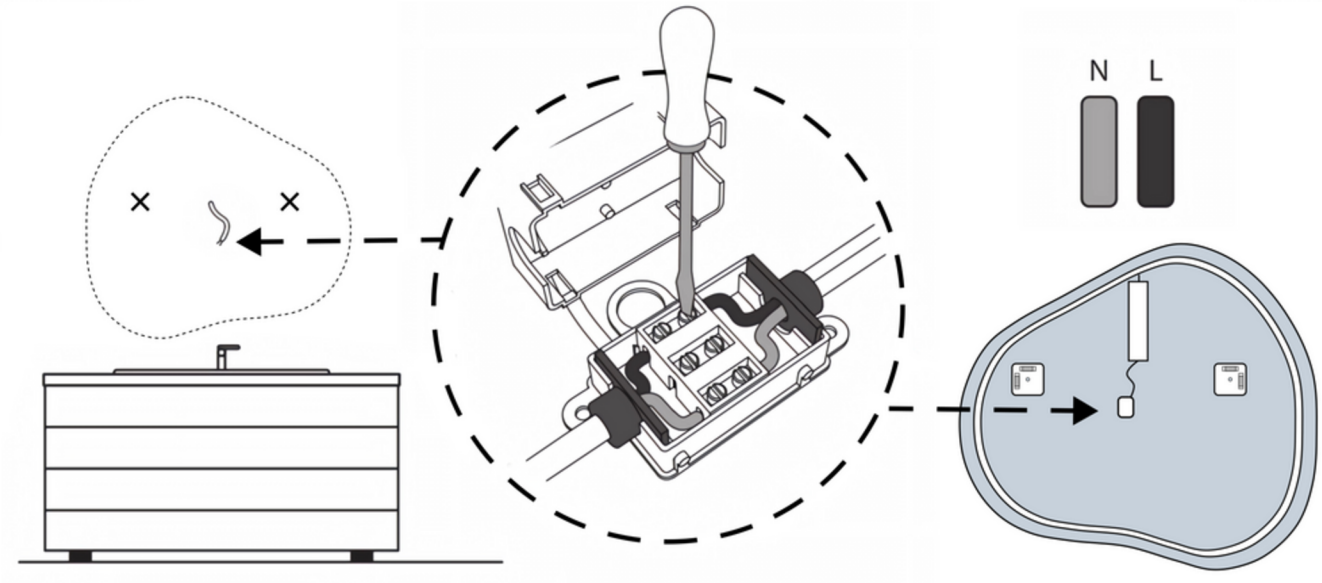
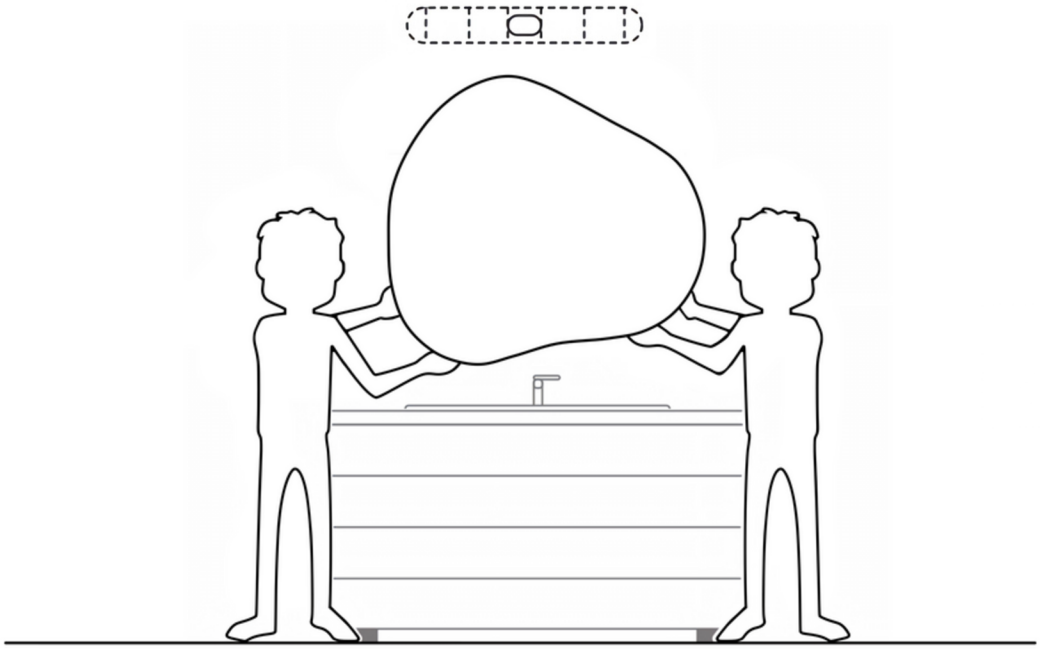
4

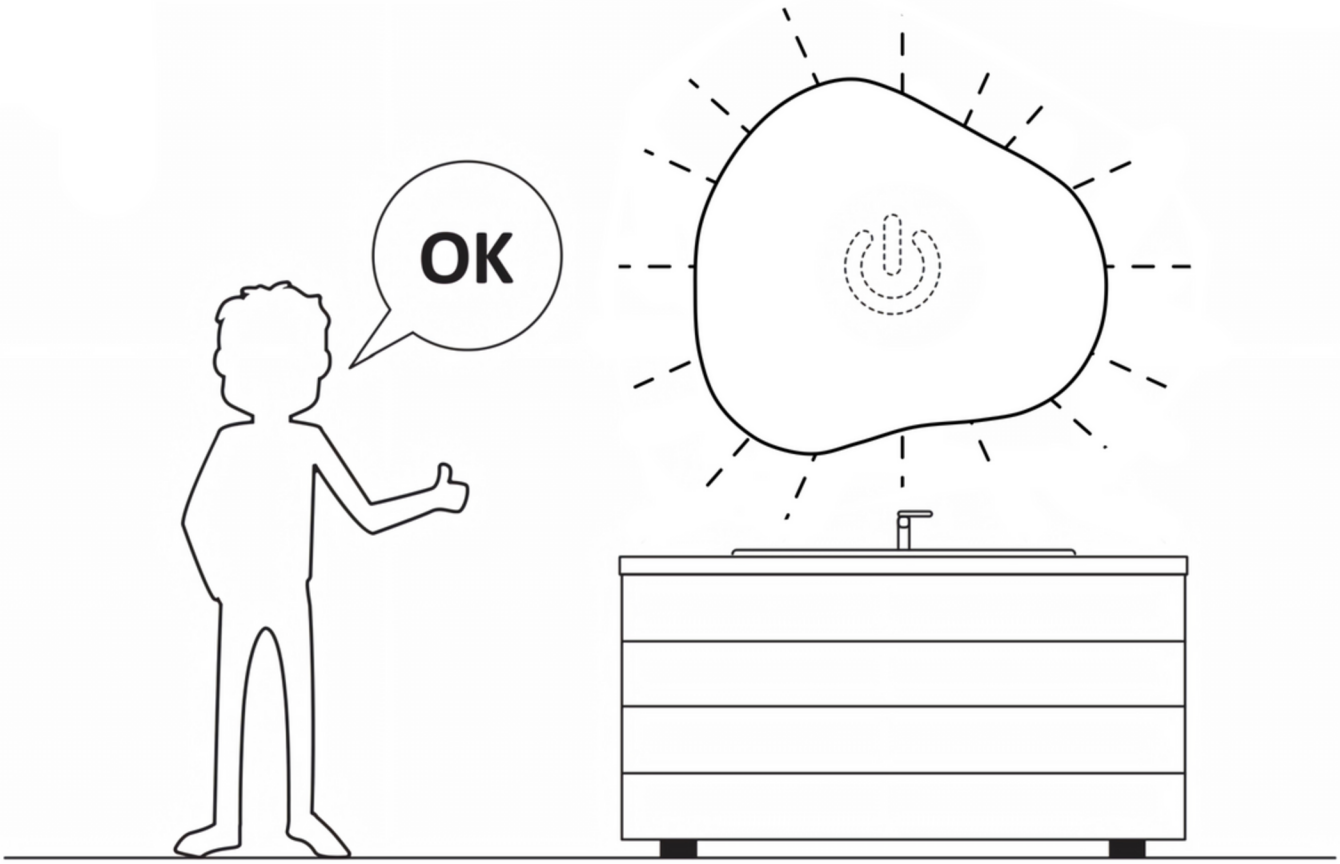
Connect the wires using an electrical connector.
Before connecting the wires to the terminal block, strip about 5 mm of insulation from around the wires. The terminal block has 2 or 3 holes for the wires. There will definitely be room for: live wire = L (brown, red, or black), neutral wire = N (blue). Sometimes there's also a hole for the protective earth wire = PE (green/yellow). After inserting the wires into the terminal block, tighten the screws with a screwdriver.



5

Hang the mirror on the previously prepared mounts.
Please note that depending on the model you choose, you may need the help of an additional person to hang the mirror.



6


Once the mirror is securely mounted, activate it using your chosen solution and enjoy using our product.
